Questions for Simpatico 05.12.2026

We've been debriefing and the team is really excited about Simpatico as an option and had a few follow-up questions:

ID	Question:	Response
1	We know you mentioned you'd be able to make sure Simpatico meets accessibility requirements – is Simpatico specifically WCAG 2.2 Level AA compliant? Or a different level? Is there an accessibility audit document or something more specific our team could look at? Our policy is to aim for WCAG 2.2 for any tools.	We have an ongoing commitment to align to WCAG 2.2 guidelines for all learner-facing functionality and end-user experiences. We will vigorously monitor evolving accessibility standards and intend to incorporate future WCAG guidance and best practices as they evolve. And for clients who seek to part of our roadmap, we will give a dedicated seat in our planning to ensure we align with client needs and requirements. Authentic will commit in contract terms to adherence to WCAG and other internationally recognized guidelines for universal access. Before contract, we will also provide. • A completed VPAT (Voluntary Product Accessibility Template) • Accessibility testing and remediation summaries • Results from automated and manual accessibility evaluations • Documentation of ongoing accessibility monitoring processes Please note: Administrative and back-office interfaces are designed with accessibility best practices in mind and generally align with WCAG principles; however, certain administrative workflows may not yet fully conform to all
2	The language options were helpful to see--can you confirm if Simpatico's interface and content works with Arabic including right-to-left support?	We can, we have not fully tested Arabic, but we do not have any concerns here with the use of multi-byte character sets. We can confirm with you prior to any formalization of discussions. The database and UI support it.
3	Could you share some information about the AI integrations from a data security perspective--what AI tool is used? What are the terms of service for data access / training? (As a legal training org, we'd want to make sure our data isn't used to train an LLM that might be used by orgs that work against our mission or might oppose us in court, etc.) If we have an enterprise AI tool, can we use our own through an API?	Strict. We rope off all access and we contain it. Our clients all share the same concerns as IRAP due to IP ownership and data privacy. All models are only referencing specified content sources associated to the course, for that specific client- nothing more. All isolated and localized for each client's use. There is no sharing of these resources between clients. We use common popular LLM like CLlama and Amazon Bedrock- however you can choose your own LLM, but with strick guardrails that they are not exposed to the general web like chat gpt conversations would be.
4	For mobile options--I think you mentioned Simpatico doesn't normally do a mobile app, but I also have used PLI's mobile app a lot--is that through Simpatico? I don't think a mobile app is a dealbreaker for us but any other info on mobile options is helpful for us to consider.	Simpatico does not currently have a mobile app. PLI does have one, but this is build inhouse from what we know. We do however have extensive APIs that could support custom mobile apps and offline acess that then reconnects when internet is available. We've build solutions in prior experience that supported offline Course content, then reconnecting to an LMS when possible.
5	Is there a way for our Tech team to do a full run-through to check for compatibility and a program staff member to test out using ourselves?	Sure, what type of test are you thinking to do. ? We can setup a staging site and you can review all and we can open up to a discussion with our technical leads.
6	Pricing - it would be great to get the details on pricing. We really need to think through different scenarios, understand what the pricing would be, and what IRAP's options would be depending on the "success" of an LMS.	Sure, no issue. We do a lot of work here to model pricing to help our clients align with their usage patterns and audience size. If we can have a discussion on the types of users, counts of audiences, and may be the seasonality of usage - we can tailor pricing further. For example, we have crafted a pricing model for a client that has all its usage in 1 time in the year, all users just use it once, and won't return until the following year. This called for specific pricing. In short, we can help- we just need ot know more details.
6a.	We have our 120 staff at a minimum; globally we have around 150 referral partner organizations (though those have been trained already, so we could roll out access slowly)	No concern here on usage. If we know the regions around the world, this may help us make sure we can provide good service. We also have plans to expand to Alexandria Egypt with support staff in our ongoing plans.
6b.	Several hundred new law students and pro bono attorneys (though those have been--we don't use an LMS now so could roll it in slowly; also many are users whom we could 'retire' accounts for as casework or semesters finish up) and interpreters who work with us.	This is good to know and we can certainly plan to support these new users who come with dedicated onboarding to help them know how to use the platform.
6c.	We also should plan for the possibility of in-depth training and resource-sharing for some of our legal aid network--for example, attorneys at resettlement agencies who represent clients and may want to access training on asylum law (through the SIJV course that you helpfully pulled from!).	We can make this a flat predictable pricing for you, we chip our own resources and license subsidies to mirror how your own team is providing services at reduced costs. We likely just need to document it all, but no hesitation to do that, so long as we can jointly share the success - when the program is successful (And of course you choose to agree to share the success).
6d.	As the questions I sent noted, given the above, it's hard to predict exact usage, but we really need to understand how we can both make the LMS a tool for those networks but also stay within budget.	We can work with you to set numbers that support the additional networks. We can discuss setting a maximum annual investment for two years (all in, for all global traffic). We request that you let us know of any major changes so we can prepare accordingly.
